First there were paper documents. Then came digital documents. And now we're on the verge of a series of stunning advancements that will change the way people work with documents and the valuable information they contain.

These emerging innovations will break down the barriers between paper and digital documents ... unlock informational content from their document containers ... and keep pace with the latest developments in cloud computing and Web 3.0.

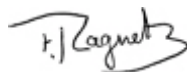

One more thing. The documents of the not-too-distant future will act as intelligent agents on your behalf, automatically searching for relevant information and increasing your productivity.

Be sure to watch my [YouTube video](#) to get an overview of these exciting developments and explore my latest whitepaper. [Document 3.0: How the next generation of dynamic documents will improve the way we work.](#)
